---

## Nth Fibonacci

Write a program to return the nth number in the fibonacci series. The value of N will be passed to the program as input.

NOTE: Fibonacci series looks like –

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, . . . and so on.

i.e. Fibonacci series starts with 0 and 1, and continues generating the next number as the sum of the previous two numbers.

- first Fibonacci number is 0,
- second Fibonacci number is 1,
- third Fibonacci number is 1,
- fourth Fibonacci number is 2,
- fifth Fibonacci number is 3,
- sixth Fibonacci number is 5,
- seventh Fibonacci number is 8, and so on.

**For example:**

Input	Result
1	0
4	2
7	8

**Program:**

```
a=int(input()) b=0 c=1
```

```
if(a==1):    print("0")
```

```
elif(a==2):    print("1")
```

```
else:        for i in range
```

```
(3,a+1):
```

```
    d=b+c
```

```
b=c          c=d
```

```
print(d)
```

	Input	Expected	Got	
✓	1	0	0	✓
✓	4	2	2	✓
✓	7	8	8	✓

**Ex. No. : 4.2****Date: 12.04.24**

## Factors of a number

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number).

**For example:**

Inpu t	Result
20	1 2 4 5 10 20

**Program:**

```
a=int(input())  
for i in  
range(1,a+1):  
if(a%i==0):  
    print(i,end=" ")
```

	Input	Expected	Got	
✓	20	1 2 4 5 10 20	1 2 4 5 10 20	✓
✓	5	1 5	1 5	✓
✓	13	1 13	1 13	✓

### Product of single digit

Given a positive integer N, check whether it can be represented as a product of single digit numbers.

Input Format:

Single Integer input.

Output Format:

Output displays Yes if condition satisfies else prints No.

Example Input:

14

Output:

Yes

Example Input:

13

Output:

No

**Program:**

```
a=int(input()) c=0 for i in range(1,10):
```

```
for j in range(1,10):
```

```
if i*j==a:
```

```
c=1
```

```
if(c==1):
```

```
print("Yes")
```

```
▼ else:
```

```
print("No")
```

	Input	Expected	Got	
✓	14	Yes	Yes	✓
✓	13	No	No	✓

## Unique Digit Count

Write a program to find the count of unique digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number  $\geq 1$  and  $\leq 25000$ .

For e.g.

If the given number is 292, the program should return 2 because there are only 2 unique digits '2' and '9' in this number

If the given number is 1015, the program should return 3 because there are 3 unique digits in this number, '1', '0', and '5'.

**For example:**

Input	Result
292	2
1015	3

### **Program:**

```
a=input()
```

```
b=len(set(a))
```

```
print(b)
```

	Input	Expected	Got	
✓	292	2	2	✓
✓	1015	3	3	✓
✓	123	3	3	✓

## Non Repeated Digit Count

Write a program to find the count of non-repeated digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number  $\geq 1$  and  $\leq 25000$ .

Some examples are as below.

If the given number is 292, the program should return 1 because there is only 1 nonrepeated digit '9' in this number

If the given number is 1015, the program should return 2 because there are 2 nonrepeated digits in this number, '0', and '5'.

If the given number is 108, the program should return 3 because there are 3 non-repeated digits in this number, '1', '0', and '8'.

If the given number is 22, the function should return 0 because there are NO nonrepeated digits in this number.

**For example:**

Input	Result
292	1
1015	2
108	3
22	0

**Program:** a={}

for i in input: if i in a:a[i]+=1

else:a[i]=1 print(sum([1 for i in a

if a[i]==1]))

	Input	Expected	Got	
✓	292	1	1	✓
✓	1015	2	2	✓
✓	108	3	3	✓
✓	22	0	0	✓

## Next Perfect Square

Given a number N, find the next perfect square greater than N.

Input Format:

Integer input from stdin.

Output Format:

Perfect square greater than N.

Example Input:

10

Output:

16

### **Program:**

```
import math
a=int(input())
b = a + 1
while b > 0 :
    m=math.sqrt(b)
    if(m==int(m)):
        print(b)
    break    else:
        b = b + 1
```

	Input	Expected	Got	
✓	10	16	16	✓

## **Sum of Series**

Write a program to find the sum of the series  $1 + 11 + 111 + 1111 + \dots + n$  terms (n will be given as input from the user and sum will be the output)

Sample Test Cases

Test Case 1

Input

4

Output

1234

Explanation:

as input is 4, have to take 4 terms.

$1 + 11 + 111 + 1111$

Test Case 2

Input

6

Output

123456

**For example:**

Input	Result
3	123

**Program:**

```
a=int(input())
```

```
t=1 s=0 for i in
```

```
range(a)
```

```
s+=t
```

```
t=t*10+1
```

---

```
print(s)
```

	Input	Expected	Got	
✓	4	1234	1234	✓
✓	6	123456	123456	✓

## Prime Checking

Write a program that finds whether the given number N is Prime or not. If the number is prime, the program should return 2 else it must return 1.

Assumption:  $2 \leq N \leq 5000$ , where N is the given number.

Example1: if the given number N is 7, the method must return 2

Example2: if the given number N is 10, the method must return 1 **For**

**example:**

Input	Result
7	2
10	1

### **Program:**

```
a=int(input()) c=0
for i in range(2,a):
    if(a%i==0):
        c=1 if(c==1):
print("1") elif(c==0):
print("2")
```

	Input	Expected	Got	
✓	7	2	2	✓
✓	10	1	1	✓

## **Disarium Number**

A Number is said to be Disarium number when the sum of its digit raised to the power of their respective positions becomes equal to the number itself. Write a program to print number is Disarium or not.

Input Format:

Single Integer Input from stdin.

Output Format:

Yes or No.

Example Input:

175

Output:

Yes

Explanation  $1^1 +$

$7^2 + 5^3 = 175$

Example Input:

123

Output:

No

**For example:**

Input	Result
175	Yes
123	No

**Program:**

```
a=input() n=len(a) r=0
```

```
for i,d in enumerate(a):
```

```
    r+=int(d)**(i+1)    if
```

```
    r==int(a):
```

```
        print("Yes")    else:
```

```
            print("No")
```

	Input	Expected	Got	
✓	175	Yes	Yes	✓
✓	123	No	No	✓

## Perfect Square After adding One

Given an integer N, check whether N the given number can be made a perfect square after adding 1 to it.

Input Format:

Single integer input.

Output Format:

Yes or No.

Example Input:

24

Output:

Yes

Example Input:

26

Output:

No

**For example:**

Input	Result
24	Yes

**Program:**

```
import math
```

```
a=int(input())
```

```
b=a+1
```

```
c=math.sqrt(b)
```

```
if(c==int(c)):
```

```
print("Yes") else:
```

```
print("No")
```

	Input	Expected	Got	
✓	24	Yes	Yes	✓
✓	26	No	No	✓
